TITLE: Electromotive force observed in the epitaxial growth of germanium on germanium substrate by transport reaction with water vapor

SOURCE: AN SSSR. Doklady, v. 161, no. 5, 1965. L124-1126

TOPIC TAGS: semiconductor thin film, germanium thin film, epitaxial vapor growth, chemical transport reaction, close spaced method, electrochemical transport reaction

ABSTRACT: The electromotive force (emf) thermally generated between close-spaced germanium electrodes has been measured and the effect of this emf on the rate of germanium transport has been determined in the process of epitaxial vapor growth of germanium by means of the transport reaction of the D₂-D₂ source with water vapor. This study was undertaken to explain the electrochemical mechanics of the transport reactions taking place in the epitaxial growth of semiconductor thin films. Experiments were carried out in a horizontal quartz tube in which two single crystal germanium rods (electrodes) were placed end-to-end with 0.3-0.8 mm spacing. A molybdenum heating element made it

possible to find the temperature gradient and therefore the emf between the electrodes. A stream of hydrogen was fed through the tube. Characteristic peaks coincident with the change in direction of temperature gradient were shown on plots of the emf and current versus time of heating element. A negative charge of the "hot" rod indicated transfer of positive charges between the rods, and therefore emission from the Ge surface. The rates of transport at variable current through the source-substrate circuit were much higher than the rates calculated for comparison due to the assumption of a chemisorption mechanism following the equations: $\text{Ge} + \text{H}_2 \rightarrow \text{GeO} + \text{H}^+ + 2e^-$ (at the source) and $\text{GeO} + 2\text{H}^+ + \text{H}_2\text{O} \rightarrow \text{Ge} + \text{H}_2\text{O} - 2e^-$ (at the substrate). These transport rates, which were measured by calculation of the time required thermal dissociation of water vapor, and by the fact that the potential of the substrate in relation to that of the source was consistently positive during the growth process, are given in Table I, formulae 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, TRANSLATION: The Einstein equation containing the cosmological term for conformally planar spaces defined by a pure electromagnetic radiation field with an energy-momentum tensor $T_{ij} = k_0 k_i k_j$ (k_i - isotropic propagation vector) is solved using the known classification according to the groups of motions of conformally planar spaces. A detailed analysis is given of those solutions which allow definite groups of motions. It is shown that these solutions allow motion groups not higher than the third order, and that solutions allowing single-term

TOPIC TAGS: spin phonon interaction, electron paramagnetic resonance, EPR,
EPR spectrum, ultrasound, ultrasonics

ABSTRACT: Spin-phonon reaction was used to analyze the effect of ultrasonics on
the EPR spectrum. The directions propagation and polarization of ultrasound
were so selected as to assure the hamiltonian spin-phonon reaction ($\delta = \frac{1}{4}$) exclu-
sively with terms having an $\langle \vec{S}_i \rangle$ operator. Energy absorption was computed using
a formula based on the assumption that the external field was stationary. Analysis
of the calculations showed that the absorption spectrum contained lines other than
the usual EPR spectral peak. A measurement of their intensity permits deter-

BAUTHOR: Yel'yutin, V. P.; Lysov, B. S.; Mitin, B. S.

TITLE: Interaction between niobium and aluminum oxide

SOURCE: LVJZ. Chernaya metallurgiya, no. 5, 1965, 145-147

TOPIC TAGS: niobium, sintered niobium alloy, aluminum oxide containing alloy, aluminum oxide solubility

ABSTRACT: The dependence of the interaction of niobium with Al_2O_3 on the temperature, holding time, and Al_2O_3 content has been investigated. Compositions containing 99.8% pure niobium and 2, 4, 7, 10, or 15 vol% Al_2O_3 were degassed in vacuum at 975°K for 30 min, furnace cooled, and sintered in argon at 1675, 1875, 2075, and 2275°K for 2 and 3 hr. The content of metallic aluminum in compositions sintered for 2 hr varied randomly within wide limits regardless of the sintering temperature. A sharp variation in the aluminum content (from 0.08 to 2.10%) was observed in compositions sintered for 3 hr at 1875°K. In compositions sintered for 3 hr at 2075 and 2275°K, the aluminum content varied from 0.18 to 0.27% regardless of the Al_2O_3 content. This comparatively small scattering in the values of aluminum content in-

AP5013327

dicated that under these conditions the reaction approached an equilibrium. In compositions sintered at 1675 and 1875K a correspondingly longer holding time (10 and 5 hr, respectively) was required to achieve equilibrium. The mean equilibrium concentration of aluminum was 0.31, 0.27, 0.22, and 0.18% in alloys sintered at 1675, 1875, 2075, and 2275K. Thus, even such a thermodynamically stable oxide as Al_2O_3 cannot be regarded as an insoluble additive in Nb- Al_2O_3 compositions. It can be assumed that a similarly noticeable chemical interaction exists between niobium and other thermodynamically stable oxides (ZrO_2 , TiO_2 , etc.). Orig. art. has: 1 table.

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 12, 1965, 2208-2211

TOPIC TAGS: tungsten, aluminum oxide, silicon dioxide, molybdenum, METAL FINISHING

ABSTRACT: The wetting of tungsten and molybdenum with liquid Al_2O_3 and of tungsten with a liquid $\text{Al}_2\text{O}_3-\text{SiO}_2$ mixture was studied by placing a drop of the liquid oxide or mixture on a plate of rolled W or Mo. The drop was allowed to spread, the temperature was quickly lowered, and the area covered by the oxide was measured. A formula was derived for the dependence of this area on the mass of the drop in the absence of interaction between the liquid and solid and for small equilibrium contact angles:

$$m = \rho \pi r^2 \sqrt{k \cos \theta} - 2$$

$$m = \frac{\rho}{\sqrt{\pi}} \sqrt{k \cos \theta} - 2 \cdot S^{1/2}$$

where S is the area of spread. S was calculated from this formula for the systems $\text{W}-\text{Al}_2\text{O}_3$, $\text{W}-\text{Al}_2\text{O}_3-\text{SiO}_2$ and $\text{Mo}-\text{Al}_2\text{O}_3$, and was compared with the measured values. It was shown that

UDC: 546.78:532.64

Card 1/2

L 13561-66

ACC NR: AP6001238

as the interaction between the solid and liquid increases, the discrepancies between the two sets of values become more appreciable; in the case of Mo-Al₂O₃, the deviations from the calculated curve were much greater than in the case of W-Al₂O₃, because the effective charge of Mo is greater than that of W. Orig. art. has: 3 figures and 6 formulas.

involved the following processes: reduction of oxides by tungsten, vaporization of reduction products, reaction between the reduction products in the vapor phase, and vaporization and dissociation of oxides. The main factor determining the weight loss in the tungsten-refractory oxide system is vaporization of tungsten oxide. The time dependence of weight loss during the reaction between tungsten and aluminum oxide is shown in Fig. 1. The time dependence for tungsten-silicon oxide reaction follows a similar pattern but the weight loss is less intensive. Orig. art. has: 5 figures.

compounds

SOURCE: Zavodskaya laboratoriya, v. 32, no. 5, 1966, 626-627

TOPIC TAGS: wetting, refractory metal, liquid metal.

ABSTRACT: A unit for studying the wetting of solids with liquid refractory metals such as titanium, circonium, vanadium, chromium, niobium, molybdenum, rhenium, tantalum, and tungsten has been designed and built. The spreading of a molten metal droplet on the solid, the contact angle, and other parameters are recorded by a high-speed motion-picture camera and can also be observed by television. The unit has a water-cooled vacuum chamber where the tested specimen (150 mm long and 50 mm wide) is placed and heated by the electric current to the desired temperature, up to 3000°C. At the top of the vacuum chamber, a tiny arc furnace melts the tested metal, a droplet of which is dropped on the tested solid. A shielding gas atmosphere may be used in testing, and the vacuum in the chamber may be varied from $5 \cdot 10^{-5}$ mm Hg. at room tempera-

Abstract : On the basis of investigations a number of authors have established the degree of effect of the composition, type and condition of the waterless valley forests on the water system of the Desna River. The best results in the restricted zones were obtained from mixed and complex plantings, noted for their maximal absorption of thawed water and which aid in filtration.

TITLE: Application of Periscopic Method for the Measuring of Open-Hearth Furnace Roof Temperatures

PERIODICAL: Stal', 1959, Nr 10, pp 893-897 (USSR)

ABSTRACT: At Nizhniy Tagil Metallurgical (Nizhne-Tagil'skiy metallurgicheskiy kombinat) and Magnitogorsk Combines (Magnitogorskiy kombinat), roof surface temperatures are reliably controlled by pyrometers which were installed in September 1950 in the former, and January 1959 in the latter. Luminance temperatures within the 1,400-1,800°C range are measured with a maximum error of ± 180 °C (see Fig. 1). The space between the pyrometer top and the roof does not affect readings which are not influenced by changes in the sensitivity of the photoelectric cell caused by the time or by the fluctuation of temperatures in the pyrometer top. The assistance

Card 1/4

Application of Perisopic Method For

Roof Temperatures

75946
SOV/133-59-10-7/39

of Voronov, Yu. I. (Engineer), and Romanov, K. I. (Foreman), in building the device is acknowledged. The roof pyrometer was designed by the Central Laboratory of Automation (TsLA), in cooperation with the plant, on the basis of a Zaporozh'ye design developed by the Central Design Bureau (TsPKB) on orders of the Central Laboratory of Automation. Conclusions: (1) The pyrometer allows the detection of maximum temperature zones and decreases the effects of the flame on the pyrometer. (2) Two pyrometers should be installed along knuckles. (3) The suggested design eliminates soiling of the device, and maintenance is less time-consuming than in radiation pyrometers. (4) The roof pyrometers are recommended for experimental use in other open-hearth furnaces. In 1959 the Central Laboratory of Automation plans to launch an experimental series of industrial roof

TOPIC TAGS: ultrasonic equipment, hydrodynamic shock, nozzle

ABSTRACT: This Author Certificate presents an ultrasonic hydrodynamic emitter of the vortex type, following that of Author Certificate No. 161980. To increase the intensity of the elastic oscillations at large distances from the exit nozzle and to generate electrohydrodynamic shocks in the body of the emitter, a central electrode is added to the equipment. The nozzle serves as the second electrode for the emitter (see Fig. 1).

Problems Concerning Philosophy of Modern Natural Science (Filosofskie voprosy sovremennoego yestestvoznaniya)

PERIODICALS:

Vestnik Akademii nauk SSSR, 1959, Nr 1, pp 132-138 (USSR)

ABSTRACT:

At the end of October last year an All-Union conference took place which dealt with these problems. The conference had been convened by the Akademiya nauk (Academy of Sciences) and the Ministerstvo vysshego obrazovaniya SSSR (Ministry of Higher Education of the USSR). More than 600 well-known experts in the spheres of sciences and philosophy took part, among them Academicians and Corresponding Members, Academy of Sciences, USSR, representatives of the Academies of the Union Republics and Branch Academies as well as scientists from scientific research institutes and universities. Scientific representatives from Bulgaria, Rumania, Germany, Hungary and Czechoslovakia were guests. It was the aim of the conference to unite the creative powers of Soviet philosophers and scientists for the purpose of a dialectic-materialistic generalization of the achievements of modern science and for raising its level which is intended to contribute towards a solution of the most

Card 1/4

SOV/30-59-1-47/57

Problems Concerning Philosophy of Modern Natural Science

important scientific problems in as short a period as possible. Such were the ideas expressed by Academician A. N. Nesmeyanov, President of the AS USSR and K. V. Ostrovityanov, Chairman of the Committee for the Organization of the Conference on the occasion of their opening speeches.

Further, the following reports were heard and discussed: M. B. Mitin, Academician, spoke about Lenin's "materialism and empiricism" as the great ideological weapon for the perception and transformation of the world.

M. E. Omel'yanovskiy, Academician of the AS UkrSSR, dealt in his report with V. I. Lenin and the philosophical problems of modern physics.

B. M. Kedrov, Doctor of Philosophical Sciences, Corresponding Member, Academy of Pedagogical Sciences RSFSR, reported on the interrelation in nature of the forms of movement of matter.

V. A. Fok spoke about the interpretation of quantum mechanics.

A. D. Aleksandrov, Corresponding Member, Academy of Sciences, USSR, spoke about the philosophical meaning and the importance of the theory of relativity.

S. L. Sobolev, Academician, and A. A. Lyapunov, Professor,

Card 2/4

SOV/30-59-1-47/57

Problems Concerning Philosophy of Modern Natural Science

dealt with cybernetics and natural science.

V. A. Ambartsumyan, Academician, spoke about some methodical problems of cosmogony.

V. A. Engel'gardt, Academician, and G. M. Frank, Corresponding Member, AMS USSR reported on the role of physics and chemistry in investigating biological problems.

A. I. Oparin, Academician spoke about the formation of life in the light of the achievements of modern natural science. N. I. Grashchenkov's report dealt with the Lenin's reflex theory and modern physiology of the sensual organs.

A. Z. Zhmudskiy opposed the opinion expressed by M. E. Omel'-yanovskiy who said that in the capitalist countries a crisis in physics is approaching.

D. I. Blokhintsev, Ya. Terletskiy, D. D. Ivanenko, T. A. Lebedev, E. Ya. Kol'man, V. V. Perfil'yev took part in the discussion of the report delivered by V. A. Fok.

M. P. Shirokov opposed A. D. Aleksandrov's view concerning the general theory of relativity. V. I. Sviderskiy, A. I. Zel'manov, A. A. Tyapkin also took part in the discussion of A. D. Aleksandrov's report.

G. I. Naan, A. L. Zel'manov took part in the discussion of the

Card 3/4

Problems Concerning Philosophy of Modern Science

report given by V. A. Imbartsuyan. G. V. Nikol'skiy, P. K. Anokhin, G. V. Platonov took part in the discussion of the report by S. L. Sobolev and A. A. Lyapunov.

V. L. Ryzhkov, N. M. Sisakyan and I. Panchev (Bulgaria) participated in the discussion of the report delivered by V. A. Engel'gardt and G. M. Frank.

V. A. Engel'gardt and G. M. Frank participated at the discussion of the report by N. I. Grashchenkov.

P. N. Fedoseyev, Corresponding Member, Academy of Sciences, USSR concluded the conference. The results obtained at the conference were discussed at a joint meeting of the Presidium Akademii nauk SSSR (Presidium of the AS USSR) and the Kollegiya Ministerstva vysshego obrazovaniya SSSR (Board of the Ministry of Higher Education of the USSR) on January 2, 1959. Measures were outlined for the intensification of working out philosophical problems of modern science.

There is 1 Soviet reference.

Man and Nature (Chelovek i Priroda)

PERIODICAL:

Nauka i zhizn', 1959, Nr 2, p 24-28 (USSR)

ABSTRACT:

On occasion of the Twelfth International Philosophical Congress held in Venice in September 1958, the author develops, on marxist principles, a picture of man in his relation to nature. Man is and remains a member of society; and only as such did he come into possession of the means to master nature. After a multiphase social development he found in socialism his best weapon for the accomplishment of this task. With regard to the surplus population problem, the author argues against Malthusian theories and underlines the theories of the Soviet scientist L.P. Prasolov, according to which about 70% of the land of the earth can be

Title : Non-elastic dispersion of negative π^- -mesons of 300 Mev energy by complex nuclei

Periodical : Dok. AN SSSR 103/2, 219-222, Jul 11, 1955

Abstract : Experimental measurements of the angular dispersion and energy distribution in the nonelastic collisions of π^- -mesons of 300 Mev energy with nucleons are described. These measurements were conducted with the help of photo-emulsions 400 μ thick, where the π^- -mesons formed by the bombarding of a graphite target with 670 Mev protons collided with nucleons of the emulsion. The differential cross section of the elastic scattering of positive 310 MeV pions by hydrogen was measured by means of nuclear photoemulsions. The electron-sensitive photo plates with an emulsion thickness of 400μ were irradiated with a bundle of positive pions at the output of a magnetic spectrometer. The mesons were produced by bombarding a paraffin target by a bundle of 660 MeV protons of a synchrocyclotron. The scattering processes were selected by means of a microscope with an immersion objective. The acts of elastic scattering were identified by the following criteria: 1.) Angular correlation between the scattered meson and the recoil proton. 2.) Complanarity. The coplanarity condition is explicitly given. 427 scattering processes were found in the sector of dial $10-170^\circ$ (in the center of mass system). The differential scattering cross section found on the basis of these results has, according to the diagram attached, a minimum at 105° . The total scattering cross section of the positive 310 MeV pions was assumed to be $7 \cdot 10^{-27} \text{ cm}^2$. (The summation interval was 20°). The differential cross section can be expressed by the first three terms of a LEGENDRE series: $d\sigma/d\Omega = [(2,4 \pm 0,2) + (4,9 \pm 0,4)\cos^2\vartheta + (9,3 \pm 0,7)\cos^2\vartheta] \cdot 10^{-27} \text{ cm}^2/\text{sterad.}$
